Chapter 17

µC/OS-II Configuration Manual

This chapter provides a description of the configurable elements of µC/OS-II. Because µC/OS-II is provided in source form, configuration is done through a number of `#define` constants, which are found in `OS_CFG.H` and should exist for each project/product that you develop. In other words, configuration is done via conditional compilation.

Instead of creating an `OS_CFG.H` file from scratch, it is recommended that you copy and modify one of the `OS_CFG.H` files provided in one of the examples that came with µC/OS-II. `OS_CFG.H` is independent of the type of CPU used.

This section describes each of the `#define` constants in `OS_CFG.H`.

17.00 Miscellaneous

OS_ARG_CHK_EN

`OS_ARG_CHK_EN` indicates whether you want most of µC/OS-II functions to perform argument checking. When set to `1`, µC/OS-II will ensure that pointers passed to functions are non-`NULL`, that arguments passed are within allowable range and more. `OS_ARG_CHK_EN` was added to reduce the amount of code space and processing time required by µC/OS-II. Set `OS_ARG_CHK_EN` to `0` if you must reduce code space to a minimum. In general, you should always enable argument checking and thus set `OS_ARG_CHK_EN` to 1.

OS_CPU_HOOKS_EN

`OS_CPU_HOOKS_EN` indicates whether `OS_CPU_C.C` declares the hook function (when set to `1`) or not (when set to `0`). Recall that µC/OS-II expects the presence of nine functions that can be defined either in the port (i.e., in `OS_CPU_C.C`) or by the application code. These functions are

```
OSInitHookBegin()          OSTaskDelHook()            OSTCBInitHook()
OSInitHookEnd()            OSTaskIdleHook()           OSTimeTickHook()
                           OSTaskStatHook()
OSTaskCreateHook()         OSTaskSwHook()
```

OS_DEBUG_EN

When set to 1, this #define adds ROM constants located in OS_CORE.C to help support kernel aware debuggers. Specifically, a number of named ROM variables can be queried by a debugger to find out about compiled-in options. For example, the debugger can find out the size of an OS_TCB, µC/OS-II's version number, the size of an event flag group (OS_FLAG_GRP) and much more.

OS_EVENT_NAME_SIZE

This constant determines the maximum number of characters that would be used to assign a name to either a semaphore, a mutex, a mailbox or a message queue. The name of these 'objects' would thus have to be smaller (in size) than this value. If OS_EVENT_NAME_SIZE is set to 0, this feature is disabled. OS_EVENT_NAME_SIZE needs to accommodate a NUL terminated ASCII string. You should note that need to use OSEventNameSet() to set the name of either a semaphores, a mutex, a mailbox or a message queue. You need to use OSEventNameGet() to obtain the name of either a semaphores, a mutex, a mailbox or a message queue.

OS_LOWEST_PRIO

OS_LOWEST_PRIO specifies the lowest task priority (i.e., highest number) that you intend to use in your application and is provided to reduce the amount of RAM needed by µC/OS-II. Remember that µC/OS-II priorities can go from 0 (highest priority) to a maximum of 63 (lowest possible priority). Setting OS_LOWEST_PRIO to a value less than 63 means that your application cannot create tasks with a priority number higher than OS_LOWEST_PRIO. In fact, µC/OS-II reserves priorities OS_LOWEST_PRIO and OS_LOWEST_PRIO-1 for itself; OS_LOWEST_PRIO is reserved for the idle task, OS_TaskIdle(), and OS_LOWEST_PRIO-1 is reserved for the statistic task, OS_TaskStat(). The priorities of your application tasks can thus take a value between 0 and OS_LOWEST_PRIO-2 (inclusive). The lowest task priority specified by OS_LOWEST_PRIO is independent of OS_MAX_TASKS. For example, you can set OS_MAX_TASKS to 10 and OS_LOWEST_PRIO to 32 and have up to 10 application tasks, each of which can have a task priority value between 0 and 30 (inclusive). Note that each task must still have a different priority value. You must always set OS_LOWEST_PRIO to a value greater than the number of application tasks in your system. For example, if you set OS_MAX_TASKS to 20 and OS_LOWEST_PRIO to 10, you can not create more than eight application tasks (0, □ , 7). You are simply wasting RAM.

OS_MAX_EVENTS

OS_MAX_EVENTS specifies the maximum number of event control blocks that can be allocated. An event control block is needed for every message mailbox, message queue, mutual exclusion semaphore, or semaphore object. For example, if you have 10 mailboxes, five queues, four mutexes, and three semaphores, you must set OS_MAX_EVENTS to at least 22. OS_MAX_EVENTS must be greater than 0. See also OS_MBOX_EN, OS_Q_EN, OS_MUTEX_EN, and OS_SEM_EN.

OS_MAX_FLAGS

OS_MAX_FLAGS specifies the maximum number of event flags that you need in your application. OS_MAX_FLAGS must be greater than 0. To use event-flag services, you also need to set OS_FLAG_EN to 1.

OS_MAX_MEM_PART

OS_MAX_MEM_PART specifies the maximum number of memory partitions that can be managed by the memory-partition manager found in OS_MEM.C. To use a memory partition, however, you also need to set OS_MEM_EN to 1. If you intend to use memory partitions, OS_MAX_MEM_PART must be greater than 0. In other words, you are allowed to only have one memory partition.

OS_MAX_QS

OS_MAX_QS specifies the maximum number of message queues that your application can create. To use message-queue services, you also need to set OS_Q_EN to 1. OS_MAX_QS must be greater than 0. In other words,

you are allowed to only have one message queue.

OS_MAX_TASKS

OS_MAX_TASKS specifies the maximum number of *application* tasks that can exist in your application. Note that OS_MAX_TASKS cannot be greater than 62 because µC/OS-II currently reserves two tasks for itself (see OS_N_SYS_TASKS in uCOS_II.H). If you set OS_MAX_TASKS to the exact number of tasks in your system, you need to make sure that you revise this value when you add additional tasks. Conversely, if you make OS_MAX_TASKS much higher than your current task requirements (for future expansion), you are wasting valuable RAM. If RAM is not a problem for your product, you should set OS_MAX_TASKS to 62.

OS_SHED_LOCK_EN

This constant enables (when set to 1) or disables (when set to 0) code generation for the two functions OSShedLock() and OSShedUnlock().

OS_TICKS_PER_SEC

OS_TICKS_PER_SEC specifies the rate at which you call OSTimeTick(). It is up to your initialization code to ensure that OSTimeTick() is invoked at this rate. This constant is used by OSStatInit(), OS_TaskStat(), and OSTimeDlyHMSM().

OS_TICK_STEP_EN

µC/OS-View (a Micrium product that allows you to display run-time data about your tasks on a Windows-based PC) can now 'halt' µC/OS-II's tick processing and allow you to issue 'step' commands from µC/OS-View. In other words, µC/OS-View can prevent µC/OS-II from calling OSTimeTick() so that timeouts and time delays are no longer processed. However, though a keystroke from µC/OS-View, you can execute a single tick at a time. If OS_TIME_TICK_HOOK_EN (see below) is set to 1, OSTimeTickHook() is still executed at the regular tick rate in case you have time critical items to take care of in your application.

17.01 Event Flags

OS_FLAG_EN

OS_FLAG_EN enables (when set to 1) or disables (when set to 0) code generation of **all** the event-flag services and data structures, which reduces the amount of code and data space needed when your application does not require the use of event flags. When OS_FLAG_EN is set to 0, you do not need to enable or disable any of the other #define constants in this section.

OS_FLAG_ACCEPT_EN

OS_FLAG_ACCEPT_EN enables (when set to 1) or disables (when set to 0) the code generation of the function OSFlagAccept().

OS_FLAG_DEL_EN

OS_FLAG_DEL_EN enables (when set to 1) or disables (when set to 0) the code generation of the function OSFlagDel().

OS_FLAG_NAME_SIZE

This constant determines the maximum number of characters that would be used to assign a name to an event flag group. The name of event flags would thus have to be smaller (in size) than this value. If OS_FLAG_NAME_SIZE is set to 0, this feature is disabled. OS_FLAG_NAME_SIZE needs to accommodate a NUL terminated ASCII string.

OS_FLAG_WAIT_CLR_EN

OS_FLAG_WAIT_CLR_EN enables (when set to 1) or disables (when set to 0) the code generation used to wait for event flags to be 0 instead of 1. Generally, you want to wait for event flags to be set. However, you might also want to wait for event flags to be clear, and thus you need to enable this option.

OS_FLAG_QUERY_EN

OS_FLAG_QUERY_EN enables (when set to 1) or disables (when set to 0) the code generation of the function OSFlagQuery().

17.02 Message Mailboxes

OS_MBOX_EN

This constant enables (when set to 1) or disables (when set to 0) the code generation of **all** message-mailbox services and data structures, which reduces the amount of code space needed when your application does not require the use of message mailboxes. When `OS_MBOX_EN` is set to 0, you do not need to enable or disable any of the other `#define` constants in this section.

OS_MBOX_ACCEPT_EN

This constant enables (when set to 1) or disables (when set to 0) the code generation of the function `OSMboxAccept()`.

OS_MBOX_DEL_EN

This constant enables (when set to 1) or disables (when set to 0) the code generation of the function `OSMboxDel()`.

OS_MBOX_POST_EN

`OS_MBOX_POST_EN` enables (when set to `1`) or disables (when set to `0`) the code generation of the function `OSMboxPost()`. You can disable code generation for this function if you decide to use the more powerful function `OSMboxPostOpt()` instead.

OS_MBOX_POST_OPT_EN

`OS_MBOX_POST_OPT_EN` enables (when set to 1) or disables (when set to 0) the code generation of the function `OSMboxPostOpt()`. You can disable code generation for this function if you do not need the additional functionality provided by `OSMboxPostOpt()`. `OSMboxPost()` generates less code.

OS_MBOX_QUERY_EN

`OS_MBOX_QUERY_EN` enables (when set to 1) or disables (when set to 0) the code generation of the function `OSMboxQuery()`.

17.03 Memory Management

OS_MEM_EN

OS_MEM_EN enables (when set to 1) or disables (when set to 0) **all** code generation of the µC/OS-II partition-memory manager and its associated data structures. This feature reduces the amount of code and data space needed when your application does not require the use of memory partitions.

OS_MEM_NAME_SIZE

This constant determines the maximum number of characters that would be used to assign a name to a memory partition. The name of memory partitions would thus have to be smaller (in size) than this value. If OS_MEM_NAME_SIZE is set to 0, this feature is disabled and no RAM is used in the OS_MEM for the memory partition. OS_MEM_NAME_SIZE needs to accommodate a NUL terminated ASCII string.

OS_MEM_QUERY_EN

OS_MEM_QUERY_EN enables (when set to 1) or disables (when set to 0) the code generation of the function OSMemQuery().

17.04 Mutual Exclusion Semaphores

OS_MUTEX_EN

`OS_MUTEX_EN` enables (when set to 1) or disables (when set to 0) the code generation of **all** mutual-exclusion-semaphore services and data structures, which reduces the amount of code and data space needed when your application does not require the use of mutexes. When `OS_MUTEX_EN` is set to 0, you do not need to enable or disable any of the other `#define` constants in this section.

OS_MUTEX_ACCEPT_EN

`OS_MUTEX_ACCEPT_EN` enables (when set to 1) or disables (when set to 0) the code generation of the function `OSMutexAccept()`.

OS_MUTEX_DEL_EN

`OS_MUTEX_DEL_EN` enables (when set to 1) or disables (when set to 0) the code generation of the function `OSMutexDel()`.

OS_MUTEX_QUERY_EN

`OS_MUTEX_QUERY_EN` enables (when set to 1) or disables (when set to 0) the code generation of the function `OSMutexQuery()`.

17.05 Message Queues

OS_Q_EN

`OS_Q_EN` enables (when set to 1) or disables (when set to 0) the code generation of **all** message-queue services and data structures, which reduces the amount of code space needed when your application does not require the use of message queues. When `OS_Q_EN` is set to 0, you do not need to enable or disable any of the other `#define` constants in this section. Note that if `OS_Q_EN` is set to 0, the `#define` constant `OS_MAX_QS` is irrelevant.

OS_Q_ACCEPT_EN

`OS_Q_ACCEPT_EN` enables (when set to 1) or disables (when set to 0) the code generation of the function `OSQAccept()`.

OS_Q_DEL_EN

`OS_Q_DEL_EN` enables (when set to 1) or disables (when set to 0) the code generation of the function `OSQDel()`.

OS_Q_FLUSH_EN

`OS_Q_FLUSH_EN` enables (when set to 1) or disables (when set to 0) the code generation of the function `OSQFlush()`.

OS_Q_POST_EN

`OS_Q_POST_EN` enables (when set to 1) or disables (when set to 0) the code generation of the function `OSQPost()`. You can disable code generation for this function if you decide to use the more powerful function `OSQPostOpt()` instead.

OS_Q_POST_FRONT_EN

`OS_Q_POST_FRONT_EN` enables (when set to 1) or disables (when set to 0) the code generation of the function `OSQPostFront()`. You can disable code generation for this function if you decide to use the more powerful function `OSQPostOpt()` instead.

OS_Q_POST_OPT_EN

`OS_Q_POST_OPT_EN` enables (when set to 1) or disables (when set to 0) the code generation of the function `OSQPostOpt()`. You can disable code generation for this function if you do not need the additional functionality provided by `OSQPostOpt()`. `OSQPost()` generates less code.

OS_Q_QUERY_EN

`OS_Q_QUERY_EN` enables (when set to 1) or disables (when set to 0) the code generation of the function `OSQQuery()`.

17.06 Semaphores

OS_SEM_EN

`OS_SEM_EN` enables (when set to 1) or disables (when set to 0) **all** code generation of the µC/OS-II semaphore manager and its associated data structures, which reduces the amount of code and data space needed when your application does not require the use of semaphores. When `OS_SEM_EN` is set to 0, you do not need to enable or disable any of the other `#define` constants in this section.

OS_SEM_ACCEPT_EN

`OS_SEM_ACCEPT_EN` enables (when set to 1) or disables (when set to 0) the code generation of the function `OSSemAccept()`.

OS_SEM_DEL_EN

`OS_SEM_DEL_EN` enables (when set to 1) or disables (when set to 0) the code generation of the function `OSSemDel()`.

OS_SEM_QUERY_EN

`OS_SEM_QUERY_EN` enables (when set to 1) or disables (when set to 0) the code generation of the function `OSSemQuery()`.

17.07 Task Management

OS_TASK_CHANGE_PRIO_EN

OS_TASK_CHANGE_PRIO_EN enables (when set to 1) or disables (when set to 0) the code generation of the function OSTaskChangePrio(). If your application never changes task priorities after they are assigned, you can reduce the amount of code space used by µC/OS-II by setting OS_TASK_CHANGE_PRIO_EN to 0.

OS_TASK_CREATE_EN

OS_TASK_CREATE_EN enables (when set to 1) or disables (when set to 0) the code generation of the OSTaskCreate() function. Enabling this function makes µC/OS-II backward compatible with the µC/OS task-creation function. If your application always uses OSTaskCreateExt() (recommended), you can reduce the amount of code space used by µC/OS-II by setting OS_TASK_CREATE_EN to 0. Note that you must set at least OS_TASK_CREATE_EN or OS_TASK_CREATE_EXT_EN to 1. If you wish, you can use both.

OS_TASK_CREATE_EXT_EN

OS_TASK_CREATE_EN enables (when set to 1) or disables (when set to 0) the code generation of the function OSTaskCreateExt(), which is the extended, more powerful version of the two task-creation functions. If your application never uses OSTaskCreateExt(), you can reduce the amount of code space used by µC/OS-II by setting OS_TASK_CREATE_EXT_EN to 0. Note that you need the extended task-create function to use the stack-checking function OSTaskStkChk().

OS_TASK_DEL_EN

OS_TASK_DEL_EN enables (when set to 1) or disables (when set to 0) code generation of the function OSTaskDel(), which deletes tasks. If your application never uses this function, you can reduce the amount of code space used by µC/OS-II by setting OS_TASK_DEL_EN to 0.

OS_TASK_IDLE_STK_SIZE

OS_TASK_IDLE_STK_SIZE specifies the size of the µC/OS-II idle-task stack. The size is specified not in bytes but in number of elements. This is because a stack is declared to be of type OS_STK. The size of the idle-task stack depends on the processor you are using and the deepest anticipated interrupt-nesting level. Very little is being done in the idle task, but you should allow at least enough space to store all processor registers on the stack and enough storage to handle all nested interrupts.

OS_TASK_NAME_SIZE

This constant determines the maximum number of characters that would be used to assign a name to a task. The name of tasks would thus have to be smaller (in size) than this value. If OS_TASK_NAME_SIZE is set to 0, this feature is disabled and no RAM is used in the OS_TCB for the task name. OS_TASK_NAME_SIZE needs to accommodate a NUL terminated ASCII string.

OS_TASK_PROFILE_EN

This constant allows variables to be allocated in each task's OS_TCB that hold performance data about each task. Specifically, if OS_TASK_PROFILE_EN is set to 1, each task will have a variable to keep track of the number of context switches, the task execution time, the number of bytes used by the task and more.

OS_TASK_STAT_EN

OS_TASK_STAT_EN specifies whether or not you can enable the µC/OS-II statistic task, as well as its initialization function. When set to 1, the statistic task OS_TaskStat() and the statistic-task-initialization function are enabled. OS_TaskStat() computes the CPU usage of your application. When enabled, it executes every second and computes the 8-bit variable OSCPUUsage, which provides the percentage of CPU use of your application. OS_TaskStat() calls OSTaskStatHook() every time it executes so that you can add your own statistics as needed. See OS_CORE.C for details on the statistic task. The priority of OS_TaskStat() is always set to OS_LOWEST_PRIO-1.

The global variables OSCPUUsage, OSIdleCtrMax, OSIdleCtrRun, OSTaskStatStk[], and OSStatRdy are not declared when OS_TASK_STAT_EN is set to 0, which reduces the amount of RAM needed by µC/OS-II if you don't intend to use the statistic task. OSIdleCtrRun contains a snapshot of OSIdleCtr just before OSIdleCtr is cleared to zero every second. OSIdleCtrRun is not used by µC/OS-II for any other purpose. However, you can read and display OSIdleCtrRun if needed.

OS_TASK_STAT_STK_CHK_EN

This constant allows the statistic task to determine the actual stack usage of each active task. If OS_TASK_STAT_EN is set to 0 (the statistic task is not enabled) but, you can call OS_TaskStatStkChk() yourself from one of your tasks. If OS_TASK_STAT_EN is set to 1, stack sizes will be determined every second by the statistic task.

OS_TASK_STAT_STK_SIZE

OS_TASK_STAT_STK_SIZE specifies the size of the µC/OS-II statistic-task stack. The size is specified not in bytes but in number of elements. This is because a stack is declared as being of type OS_STK. The size of the statistic-task stack depends on the processor you are using and the maximum of the following actions:

- The stack growth associated with performing 32-bit arithmetic (subtraction and division)
- The stack growth associated with calling OSTimeDly()
- The stack growth associated with calling OSTaskStatHook()
- The deepest anticipated interrupt-nesting level

If you want to run stack checking on this task and determine its actual stack requirements, you must enable code generation for OSTaskCreateExt() by setting OS_TASK_CREATE_EXT_EN to 1. Again, the priority of OS_TaskStat() is always set to OS_LOWEST_PRIO-1.

OS_TASK_SW_HOOK_EN

Normally, µC/OS-II requires that you have a context switch hook function called OSTaskSwHook(). When set to 0, this constant allows you to omit OSTaskSwHook() from your code. This configuration constant was added to reduce the amount of overhead during a context switch in applications that doesn't require the context switch hook. Of course, you will also need to remove the calls to OSTaskSwHook() from OSTaskStartHighRdy(), OSCtxSw() and OSIntCtxSw() in OS_CPU_A.ASM.

OS_TASK_SUSPEND_EN

OS_TASK_SUSPEND_EN enables (when set to 1) or disables (when set to 0) code generation of the functions OSTaskSuspend() and OSTaskResume(), which allows you to explicitly suspend and resume tasks, respectively. If your application never uses these functions, you can reduce the amount of code space used by µC/OS-II by setting OS_TASK_SUSPEND_EN to 0.

OS_TASK_QUERY_EN

OS_TASK_QUERY_EN enables (when set to 1) or disables (when set to 0) code generation of the function OSTaskQuery(). If your application never uses this function, you can reduce the amount of code space used by µC/OS-II by setting OS_TASK_QUERY_EN to 0.

17.08 Time Management

OS_TIME_DLY_HMSM_EN

`OS_TIME_DLY_HMSM_EN` enables (when set to 1) or disables (when set to 0) the code generation of the function `OSTimeDlyHMSM()`, which is used to delay a task for a specified number of hours, minutes, seconds, and milliseconds.

OS_TIME_DLY_RESUME_EN

`OS_TIME_DLY_RESUME_EN` enables (when set to 1) or disables (when set to 0) the code generation of the function `OSTimeDlyResume()`.

OS_TIME_GET_SET_EN

`OS_TIME_GET_SET_EN` enables (when set to 1) or disables (when set to 0) the code and data generation of the functions `OSTimeGet()` and `OSTimeSet()`. If you don't need to use the 32-bit tick counter `OSTime`, then you can save yourself 4 bytes of data space and code space by not having the code for these functions generated by the compiler.

OS_TIME_TICK_HOOK_EN

Normally, µC/OS-II requires the presence of a function called `OSTimeTickHook()` which is called at the very beginning of the tick ISR. When set to `0`, this constant allows you to omit `OSTimeTickHook()` from your code. This configuration constant was added to reduce the amount of overhead during a tick ISR in applications that doesn't require this hook.

17.09 Function Summary

Table 17.1 lists each µC/OS-II function by type (`Service`), indicates which variables enable the code (`Set to 1`), and lists other configuration constants that affect the function (`Other Constants`).

Of course, `OS_CFG.H` must be included when µC/OS-II is built, in order for the desired configuration to take effect.

Table 17.1 µC/OS-II functions and `#define` configuration constants.

Service	*Set to 1*	*Other Constants*
Miscellaneous		
`OSEventNameGet()`	`OS_EVENT_NAME_SIZE (>1)`	N/A
`OSEventNameSet()`	`OS_EVENT_NAME_SIZE (>1)`	N/A

`OSInit()`	N/A	`OS_MAX_EVENTS`
		`OS_Q_EN and OS_MAX_QS`
		`OS_MEM_EN`
		`OS_TASK_IDLE_STK_SIZE`
		`OS_TASK_STAT_EN`
		`OS_TASK_STAT_STK_SIZE`

`OSSchedLock()`	`OS_SCHED_LOCK_EN`	N/A
